

# DP Examples

---

- Fibonacci
- Binomial Coefficients
- Longest Common Subsequence
- Longest Increasing Subsequence
- Knapsack
- Shortest Path
- Edit Distance
- Rod Cutting
- Optimal BST

# Longest Common Subsequence

---

- Given two sequences  $x[1..m]$  and  $y[1..n]$

$$X = \langle x_1, x_2, \dots, x_m \rangle$$

$$Y = \langle y_1, y_2, \dots, y_n \rangle$$

find a maximum length common subsequence (LCS) of  $X$  and  $Y$

- Example

$$X = \langle A, B, C, B, D, A, B \rangle$$

- Subsequences of  $X$ :
  - A subset of elements from the sequence taken in order  
 $\langle A, B, D \rangle, \langle B, C, D, B \rangle$ , etc.

# Longest Common Subsequence (LCS)

Application: Comparison of two DNA strings

Ex:  $X = \langle A, B, C, B, D, A, B \rangle$ ,  $Y = \langle B, D, C, A, B, A \rangle$

Longest Common Subsequence:

$X = A \text{ BCB D A } \mathbf{B}$

$Y = \mathbf{B D C A B } A$

$\langle B, D, B \rangle$  is a common subsequence with length 3  
but is it the longest?

# LCS is not unique

---

$X = \langle A, B, C, B, D, A, B \rangle$

$Y = \langle B, D, C, A, B, A \rangle$

$X = \langle A, B, C, B, D, A, B \rangle$

$Y = \langle B, D, C, A, B, A \rangle$

- $\langle B, C, B, A \rangle$  and  $\langle B, D, A, B \rangle$  are longest common subsequences of  $X$  and  $Y$  (length = 4)
- $\langle B, C, A \rangle$  is a CS of  $X$  and  $Y$  but not the longest

# Brute-Force Solution

---

- For every subsequence of  $X$ , check whether it's a subsequence of  $Y$
- There are  $2^m$  subsequences of  $X$  to check
- Each subsequence takes  $\Theta(n)$  time to check
  - scan  $Y$  for first letter, from there scan for second, and so on
- Running time:  $\Theta(n2^m)$

# Steps in Dynamic Programming

---

1. Characterize structure of an optimal solution.
2. Define value of optimal solution recursively.
3. Compute optimal solution values **bottom-up** in a table.
4. Construct an optimal solution from computed values.

We'll study these with the help of examples.

# Notations

---

- Given a sequence  $X = \langle x_1, x_2, \dots, x_m \rangle$  we define the  $i$ -th prefix of  $X$ , for  $i = 0, 1, 2, \dots, m$

$$X_i = \langle x_1, x_2, \dots, x_i \rangle \text{ or } x[1, \dots, i]$$

$$Y_j = \langle y_1, y_2, \dots, y_j \rangle \text{ or } y[1, \dots, j]$$

- $c[i, j]$  = the length of a LCS of the sequences

$$X_i = \langle x_1, x_2, \dots, x_i \rangle \text{ and } Y_j = \langle y_1, y_2, \dots, y_j \rangle$$

# Making the choice

---

$X = \langle A, B, D, E \rangle$

$Y = \langle Z, B, E \rangle$

- Choice: include one element into the common sequence (E) and solve the resulting subproblem

$X = \langle A, B, D, G \rangle$

$Y = \langle Z, B, D \rangle$

- Choice: exclude an element from a string and solve the resulting subproblem

# A Recursive Solution

---

Case 1:  $x_i = y_j$

$X_i = \langle A, B, D, E \rangle$

$Y_j = \langle Z, B, E \rangle$

$$c[i, j] = c[i-1, j-1] + 1$$

- Append  $x_i = y_j$  to the LCS of  $X_{i-1}$  and  $Y_{j-1}$
- Must find a LCS of  $X_{i-1}$  and  $Y_{j-1} \Rightarrow$  optimal solution to a problem includes optimal solutions to subproblems

# A Recursive Solution

---

Case 2:  $x_i \neq y_j$

$$X_i = \langle A, B, D, G \rangle$$

$$Y_j = \langle Z, B, D \rangle$$

$$c[i, j] = \max \{ c[i-1, j], c[i, j-1] \}$$

– Must solve two problems

- find a LCS of  $X_{i-1}$  and  $Y_j$ :  $X_{i-1} = \langle A, B, D \rangle$  and  $Y_j = \langle Z, B, D \rangle$
- find a LCS of  $X_i$  and  $Y_{j-1}$ :  $X_i = \langle A, B, D, G \rangle$  and  $Y_{j-1} = \langle Z, B \rangle$
- Optimal solution to a problem includes optimal solutions to subproblems

# Overlapping Subproblems

---

- To find a LCS of  $X$  and  $Y$ 
  - we may need to find the LCS between  $X$  and  $Y_{n-1}$  and that of  $X_{m-1}$  and  $Y$
  - Both the above subproblems has the subproblem of finding the LCS of  $X_{m-1}$  and  $Y_{n-1}$
- Subproblems share subsubproblems

# LCS Algorithm

---

- First we'll find the length of LCS. Later we'll modify the algorithm to find LCS itself.
- Define  $X_i, Y_j$  to be the prefixes of  $X$  and  $Y$  of length  $i$  and  $j$  respectively
- Define  $c[i,j]$  to be the length of LCS of  $X_i$  and  $Y_j$
- Then the length of LCS of  $X$  and  $Y$  will be  $c[m,n]$

$$c[i, j] = \begin{cases} 0 & i = 0 \text{ or } j = 0, \\ c[i-1, j-1] + 1 & \text{if } x[i] = y[j], \\ \max(c[i, j-1], c[i-1, j]) & \text{otherwise} \end{cases}$$

# LCS recursive solution

---

$$c[i, j] = \begin{cases} c[i-1, j-1] + 1 & \text{if } x[i] = y[j], \\ \max(c[i, j-1], c[i-1, j]) & \text{otherwise} \end{cases}$$

- We start with  $i = j = 0$  (empty substrings of  $x$  and  $y$ )
- Since  $X_0$  and  $Y_0$  are empty strings, their LCS is always empty (i.e.  $c[0, 0] = 0$ )
- LCS of empty string and any other string is empty, so for every  $i$  and  $j$ :  $c[0, j] = c[i, 0] = 0$

# LCS recursive solution

---

$$c[i, j] = \begin{cases} c[i-1, j-1] + 1 & \text{if } x[i] = y[j], \\ \max(c[i, j-1], c[i-1, j]) & \text{otherwise} \end{cases}$$

- When we calculate  $c[i, j]$ , we consider two cases:
- **First case:**  $x[i]=y[j]$ : one more symbol in strings  $X$  and  $Y$  matches, so the length of LCS  $X_i$  and  $Y_j$  equals to the length of LCS of smaller strings  $X_{i-1}$  and  $Y_{j-1}$ , plus 1

# LCS recursive solution

---

$$c[i, j] = \begin{cases} c[i-1, j-1] + 1 & \text{if } x[i] = y[j], \\ \max(c[i, j-1], c[i-1, j]) & \text{otherwise} \end{cases}$$

- **Second case:**  $x[i] \neq y[j]$
- As symbols don't match, our solution is not improved, and the length of  $\text{LCS}(X_i, Y_j)$  is the same as before (i.e. maximum of  $\text{LCS}(X_i, Y_{j-1})$  and  $\text{LCS}(X_{i-1}, Y_j)$ )

# LCS Length Algorithm

---

LCS-Length(X, Y)

m = length(X) // get the # of symbols in X

n = length(Y) // get the # of symbols in Y

for i = 1 to m

    c[i,0] = 0 // special case:  $Y_0$

for j = 1 to n

    c[0,j] = 0 // special case:  $X_0$

for i = 1 to m // for all  $X_i$

    for j = 1 to n // for all  $Y_j$

        if (  $X_i == Y_j$  )

            c[i,j] = c[i-1,j-1] + 1

        else c[i,j] = max( c[i-1,j], c[i,j-1] )

return c

# LCS Example

---

We'll see how LCS algorithm works on the following example:

X = ABCB

Y = BDCAB

# LCS Example (0)

ABCB  
BDCAB

i		Y <sub>j</sub>	B	D	C	A	B
0	X <sub>i</sub>						
1	A						
2	B						
3	C						
4	B						

$X = \text{ABCB}; \quad m = |X| = 4$

$Y = \text{BDCAB}; \quad n = |Y| = 5$

Allocate array  $c[4,5]$

# LCS Example (1)

ABCB  
BDCAB

		j	0	1	2	3	4	5
i		Y <sub>j</sub>	B	D	C	A	B	
0	X <sub>i</sub>		0	0	0	0	0	0
1	A		0					
2	B		0					
3	C		0					
4	B		0					

for i = 1 to m      c[i,0] = 0  
for j = 1 to n      c[0,j] = 0

# LCS Example (2)

A B C B  
B D C A B

		j	0	1	2	3	4	5
		Y <sub>j</sub>		B	D	C	A	B
i	X <sub>i</sub>							
0		0	0	0	0	0	0	0
1	A	0	→ 0					
2	B	0						
3	C	0						
4	B	0						

if (  $X_i == Y_j$  )  
 $c[i,j] = c[i-1,j-1] + 1$   
 else  $c[i,j] = \max( c[i-1,j], c[i,j-1] )$

# LCS Algorithm Running Time

---

- LCS algorithm calculates the values of each entry of the array  $c[m,n]$
- So what is the running time?

$O(mn)$

since each  $c[i,j]$  is calculated in constant time, and there are  $m*n$  elements in the array

# Finding LCS

		j	0	1	2	3	4	5
i		Y <sub>j</sub>	B	D	C	A	B	
0	X <sub>i</sub>	0	0	0	0	0	0

3	C	0	1	1	2	2	2	
4	B	0	1	1	2	2	3	

# Finding LCS (2)

LCS (reversed order):

**B C B**

LCS (straight order):

**B C B**

# Additional Information

$$c[i, j] = \begin{cases} 0 & \text{if } i, j = 0 \\ c[i-1, j-1] + 1 & \text{if } x_i = y_j \\ \max(c[i, j-1], c[i-1, j]) & \text{if } x_i \neq y_j \end{cases}$$

b & c:

	0	1	2	3		n
	$y_j$	A	C	D		F
0	$x_i$	0	0	0	0	0
1	A	0				
2	B	0				
3	C	0				
m	D	0				

j

i

Diagram annotations: An arrow points from the cell (3, C) to the cell (2, C), labeled  $c[i, j-1]$ . Another arrow points from the cell (3, C) to the cell (3, D), labeled  $c[i-1, j]$ .

A matrix  $b[i, j]$ :

- For a subproblem  $[i, j]$  it tells us what choice was made to obtain the optimal value
- If  $x_i = y_j$   
 $b[i, j] = \text{“ ”}$
- Else, if  $c[i - 1, j] \geq c[i, j-1]$   
 $b[i, j] = \text{“ } \uparrow \text{”}$
- else  
 $b[i, j] = \text{“ } \leftarrow \text{”}$

# Example

$X = \langle A, B, C, B, D, A \rangle$

$Y = \langle B, D, C, A, B, A \rangle$

$$c[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ c[i-1, j-1] + 1 & \text{if } x_i = y_j \\ \max(c[i, j-1], c[i-1, j]) & \text{if } x_i \neq y_j \end{cases}$$

If  $x_i = y_j$

$b[i, j] = \text{"} \nearrow \text{"}$

Else if

$c[i-1, j] \geq c[i, j-1]$

$b[i, j] = \text{"} \uparrow \text{"}$

else

$b[i, j] = \text{"} \leftarrow \text{"}$

		0	1	2	3	4	5	6
	$y_j$	B	D	C	A	B	A

**} else {**

    PRINT-LCS(b, X, i, j - 1)

**}**

Initial call: PRINT-LCS(b, X, length[X], length[Y])

# Improving the Code

---

- If we only need the length of the LCS
  - LCS-LENGTH works only on two rows of  $c$  at a time.  
The row being computed and the previous row
  - We can reduce the asymptotic space requirements by storing only these two rows
